

Medisoft expands healthcare with eHealthopinion

Medisoft Telemedicine Pvt. Ltd., a research based development company established with the objective of improving health care offers web-based eHealthopinion, a classic web 2.0 application. Via eHealthopinion the company provides an innovative way to connect patients with doctors as well as referring doctors with their expert counterparts. The main aim is to create a network of doctors and patients throughout the globe breaking down barriers of time and space. This service is available for the patients and doctors worldwide.

The patient visits the website and opens his healthcare account. A simple and easy process it takes just 2 to 3 minutes to operate. In response he gets authentication information to access the application. The application enables patient to prepare profile and send it to the doctor for diagnosis, treatment, second opinion or follow up. The patient profile includes demographical information, history using ready made template, laboratory and

prescription module and data acquisition by keyboard or direct from instruments like BP, temperature, ECG, weight etc. The application has direct integration with web camera, digital camera and scanner.

On completion of profile patient provides access right for all or selected documents to doctor. Being a web based application the doctor can access the patient's data from any computer. Doctor views and interpret patient's data to send his opinion/prescription which can be read or printed by the patient.

Thus the doctor can continue relationship with patient even after the patient has left. The application is very useful for follow up and post treatment review and the service is valuable for international patients.

In the modern era of internet, eHealthopinion is a advanced health service different from the preliminary forms of the existing clinical telemedicine projects. The earlier systems fail in several criteria. There is no direct involvement for patient which is impracticable and expansion is limited. The patient and doctor of hospital where the centre is located only can utilize it. The targeted audiences are restricted and the utilization is very limited. The expert doctor needs to go up to the centre which is very inconvenient and time consuming. Moreover there is not freedom to view patient data or write prescription or line of treatment at odd hours as per convenience.

The technology advancement by Medisoft has made possible a user-friendly and convenient to use telemedicine application by email. Before developing this telemedicine system Medisoft met number of medical practitioners from urban as well as rural areas, associated with various faculties. The company focussed on what was needed in a telemedicine system that would improve patient access to healthcare. The product is the end result of their valuable opinions.

Due to indigenous effort on Telemedicine, Medisoft is able to provide low cost innovative solutions and make systems as per requirements.
